

# Weekly report #11

## Status report

Date	28-05-14
Week	18
Group	CAPGEMINI_EMR_integration

## Introduction

This is the groups final weekly report.

## Progress summary

The first half of the week was focused on doing as much work as possible on the report, which was to be delivered to our supervisor for his final feedback before the last hand-in.

We also worked a lot on the app in the remainder of the week. This because there were still some features and bugs that needed to be sorted out before we had our product demo to our customer. Some days were especially long for certain group members which worked a lot more than others. There are several reasons for this, one of them were due to the complexity of certain problems and issues that needed to be sorted out. Not everyone in the group were able to participate on these issues.

We also finished the standardisation of the android service(AIDL) which makes our app able to, in theory, talk with every hospital system there is! As long as the service is set up by technical personnel at its given hospital system.

More work were done with the database as well. We found out, in terms of optimisation, that we were doing more database queries than needed, and optimised our app in those regards. Offline-mode needed an overhaul has well, but since time were short. Work needed to be prioritised elsewhere. So the offlinemode is not ship-ready, if more time is made available, this will most likely be fixed.
